

Sendai Systems releases GroupVille 2.1 - Major new import/export and storage features

Switzerland, July 19, 2005. Sendai Systems today released the latest version of GroupVille in German and English. GroupVille is a web-based collaboration system also known as 'Groupware'.

GroupVille 2.1 adds the following new functionality:

- A 'Task Ticket' System in GV Tasks allows to look up and solve customer/business partner questions.
- A FAQ and 'Wiki' system. This allows for both formal and informal exchange of data and ideas within an organization and can also serve as an internal knowledge base.

In addition, GroupVille 2.1 includes various improvements to existing features:

- External visitors can now suggest GroupVille items (News items, FAQ and event entries...) as well as update their personal contact information.
- Calendar import over iCal. This feature complements existing data import/export. GroupVille now supports both import and export using the important vCard and iCal standards for people and calendar data.
- Ad-hoc reporting/printing in PDF format allows users to print lists such as contacts and other simple reports.
- Support for RSS in news and GroupVille user blog entries allows users to publish news and weblog items to other webpages using the popular RSS 2.0 standard.

GroupVille 2.1 also includes a preview of the new Data storage system using the WebDAV standard. A separate announcement will detail this new GV Data module.

With this release, all major internal improvements for the GroupVille 2.x series are implemented. GroupVille will be further enhanced in exchange with other applications and mobile devices in future releases.

GroupVille 2.1 runs on OS X Server 10.3.x or 10.4.x Server using Apple's WebObjects 5.2 Java application server.
